

NEW SUMP AND PUMP SYSTEM FROM BASEMENT SYSTEMS.

Basement Systems announce a new sump pump system to complement its existing range which already includes the UK's only BBA Certified Sump and Pump System for Basements.

The liner has two barrels in a figure of eight, with a powerful mains pump sited at different heights. Above the lower pump is a battery operated system to protect in a power failure.

The unique shape of the sump liner reduces the amount of excavation required to house these pumps as compared with a cylinder rectangle.

Known as the 'Triple Safe System' The second mains pump gives back up in the event of a primary pump failure in and adds to pumping capacity if the flow rate into the sump exceeds the capacity of the primary pump (typically over 2.5 litres / sec).

The battery back up system can be configured with one or two high power 88 ampere batteries each capable of pumping around 30 – 40 m³ of water in a typical installation on a single charge.

'Basement Systems'- the forefront of innovative design and technology for basement waterproofing.
