

NEW WINDOW WELL SYSTEM FOR BASEMENT WINDOWS

Basement Systems have developed a new Window well system for Basement Windows.

This is intended to be the forerunner of a whole new range of window well systems designed to enhance basement environments.

This initial system comprises a windowwell liner that is light reflective and a Perspex top that allows light down into the basement. There are two versions of the top – the lower and the raised version.

Currently neither will allow opening so they cannot be used as a ‘means of escape’ but future developments are planned that will introduce this feature.

The systems are designed to be used with Basement Systems’ range of Basement waterproofing / water control products including drained cavity wall membrane and the famous Watguard and Supersump System which is the U.K.’s only BBA certified system. of its kind.
